Pre-Requisites Overview

The A Comprehensive Measure of Well-Being project requires both technical knowledge and software tools before development begins. A basic understanding of database management, programming concepts, and web technologies is essential. Developers should be familiar with Entity Relationship (ER) Diagrams, SQL, and database normalization. Knowledge of HTML, CSS, and JavaScript helps in designing the user interface. Understanding backend technologies such as Python or Java is useful for implementing application logic. Familiarity with data analysis concepts is beneficial for interpreting well-being data. Proper system planning and requirement analysis should be completed before development. These prerequisites ensure the successful implementation of the project.

Software and Hardware Requirements

The project requires a computer with at least 4 GB RAM, a dual-core processor, and sufficient storage space. The operating system can be Windows, Linux, or macOS. Software tools include Visual Studio Code for coding, MySQL for database management, and Draw.io or Lucidchart for designing ER diagrams. A modern web browser such as Google Chrome or Microsoft Edge is required for testing. Git or GitHub can be used for version control. A stable internet connection is recommended for downloading libraries and project resources.

```
Software Requirements
 ■■ VS Code
 ■■ MySQL
 ■■ Draw.io
 ■■ Chrome
```

Skills Required

Developers should have knowledge of database design, SQL queries, and relational database concepts. Basic programming skills in Python, Java, or JavaScript are important. Problem-solving and logical thinking are essential. Understanding of SDLC improves project planning. Communication and teamwork skills are also necessary. Knowledge of health and well-being metrics provides a better understanding of the project's objectives. Meeting these prerequisites helps ensure a successful and reliable well-being management system.
