

Epic 2: Importing Required Libraries

Required Libraries

Python libraries provide reusable functions for development.

Required libraries include Pandas, NumPy, Matplotlib, Seaborn and Scikit-learn.

These libraries simplify data analysis and visualization.

Install libraries using pip.

Verify successful installation.

Use a virtual environment.

Maintain compatible versions.

Document dependencies.

Prepare the environment.

Test installations.

Resolve installation errors.

Ready for project development.

1. ENVIRONMENT SETUP WORKFLOW

Importing Libraries

Import libraries at the beginning of the program.

```
import pandas as pd
```

```
import numpy as np
```

```
import matplotlib.pyplot as plt
```

```
import seaborn as sns
```

```
from sklearn.model_selection import train_test_split
```

Aliases improve readability.

Keep imports organized.

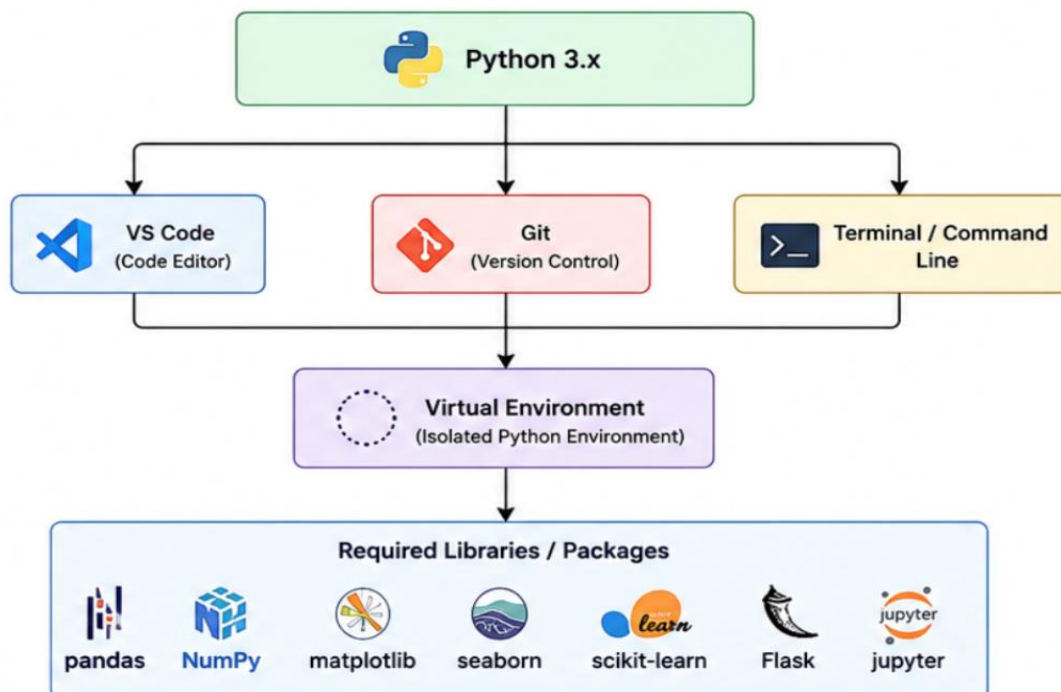

Remove unused imports.

Verify imports execute successfully.

Follow coding standards.

Begin implementation.

2. DEVELOPMENT ENVIRONMENT ARCHITECTURE

Verification

Run a sample script.

Check for ModuleNotFoundError.

Install missing packages.

Maintain requirements.txt.

Verify library versions.

Integrate libraries into the project.

Test preprocessing.

Test visualization.

Test machine learning modules.

Document the setup.

Ensure reproducibility.

Epic 2 completed successfully.
