

Epic 1: Environment Setup

This task explains the initial setup for the Comprehensive Measure of Well Being project. Install Python, VS Code, Git and required libraries. Create a virtual environment and verify installations. Download packages such as pandas, numpy, matplotlib, seaborn, scikit-learn, flask and jupyter. Use pip to install dependencies. Organize the project into data, notebooks, src, models, outputs and docs folders. Maintain requirements.txt and README.md. A proper folder structure improves maintainability, collaboration, debugging, testing and deployment. Verify that all packages import successfully before starting development. This setup ensures a stable development environment and reduces future configuration issues.

Download Required Packages

This task explains the initial setup for the Comprehensive Measure of Well Being project. Install Python, VS Code, Git and required libraries. Create a virtual environment and verify installations. Download packages such as pandas, numpy, matplotlib, seaborn, scikit-learn, flask and jupyter. Use pip to install dependencies. Organize the project into data, notebooks, src, models, outputs and docs folders. Maintain requirements.txt and README.md. A proper folder structure improves maintainability, collaboration, debugging, testing and deployment. Verify that all packages import successfully before starting development. This setup ensures a stable development environment and reduces future configuration issues.

Set Up Folder Structure

This task explains the initial setup for the Comprehensive Measure of Well Being project. Install Python, VS Code, Git and required libraries. Create a virtual environment and verify installations. Download packages such as pandas, numpy, matplotlib, seaborn, scikit-learn, flask and jupyter. Use pip to install dependencies. Organize the project into data, notebooks, src, models, outputs and docs folders. Maintain requirements.txt and README.md. A proper folder structure improves maintainability, collaboration, debugging, testing and deployment. Verify that all packages import successfully before starting development. This setup ensures a stable development environment and reduces future configuration issues.
